Development of a Real-time Facial Expression Recognition System

Description:

Facial expression recognition has a wide range of applications, including human–computer interaction, advertising, and entertainment. This project focuses on **detecting and analyzing human emotions through facial expressions**. Various **facial features** and **deep learning models** will be studied to enhance recognition accuracy. To further improve performance, **attention mechanisms** will be applied to facial images and videos. Additionally, **lightweight models** will be developed to optimize efficiency while maintaining accuracy. By the end of the project, a system capable of real-time facial expression recognition will be implemented.

Development of a Real-time Facial Expression Recognition System

- ❑ Human beings express emotions through facial expressions in daily communications
- ❑ Understanding these emotions and knowing how to react to people's expressions greatly enrich human-computer interaction

Ekman's six basic expressions
(the neutral expression not included)

Happiness

Sadness

Fear

Surprise

Disgust

Anger

Development of a Real-time Facial Expression Recognition System

❑ To perform facial expression recognition:

1. Face detection
2. Deep feature extraction (attention mechanisms, knowledge distillation to learn from a teacher network, advanced models)
3. Classification

Development of a Real-time Facial Expression Recognition System

1. Study deep learning-based facial expression recognition methods
2. Study different attention mechanisms/knowledge distillation methods to enhance facial expression recognition methods
3. Identify at least two datasets for your project
4. Investigate and evaluate at least three facial expression recognition methods
5. Explore techniques to enhance the performance of existing facial expression recognition methods (optional)
6. Present at least one paper on facial expression recognition in October 2025
